

## Algoritmi numerici pentru analiza circuitelor electriche rezistive neliniare

Prof.dr.ing. Gabriela Ciuprina

Universitatea "Politehnica" Bucureşti, Facultatea de Inginerie Electrică,  
Departamentul de Electrotehnică

Suport didactic pentru disciplina *Algoritmi numerici*,  
*Facultatea de Inginerie Electrică*, 2017-2018

## Cuprins

### 1 Introducere

- Elemente de circuit rezistive neliniare
- Formularea problemei
- Ecuări
- Exemple

### 2 Metoda nodală clasică

### 3 Descrierea caracteristicilor neliniare

- Prin cod
- Prin date

### 4 Algoritmi

- Metoda Newton
- Idei de implementare
- Preprocesare
- Procesare

## Analiza circuitelor electrice rezistive neliniare (c.c.)

### Date:

- *Topologia circuitului* (graful circuitului) - poate fi descris:
  - geometric;
  - numeric (matrice topologice/ *netlist*);
- Pentru fiecare latură liniară  $k$ :
  - tipul laturii (**R**, **SUCU**, **SICI**, **SICU**, **SUCI**, **SIT**, **SIC**);
  - caracteristica constitutivă
    - $R_k$ ;
    - parametrul de transfer  $\alpha_k, \beta_k, \gamma_k, \rho_k$ ;
    - semnalul de comandă (current/tensiune, latură/noduri);
    - parametrii surselor:  $(e_k, j_k)$

## Analiza circuitelor electrice rezistive neliniare (c.c.)

- Pentru fiecare latură neliniară  $k$ :
  - tipul laturii (**Rn**, **SUCUn**, **SICIn**, **SICUn**, **SUCIn**);
  - caracteristica constitutivă neliniară
    - $f_k(i)$  dacă controlul este în curent sau  $g_k(u)$  dacă controlul este în tensiune;
    - dependențele  $\alpha_k(u), \beta_k(i), \gamma_k(u), \rho_k(i)$ ;
    - semnalul de comandă (current/tensiune, latură/noduri);

**Se cer:**  $i_k(t), u_k(t), k = 1, 2, \dots, L$ .

Notes

---

---

---

## Ca la c.c. - cazul elementelor liniare

1 Kirchhoff I

2 Kirchhoff II

3 Ecuății constitutive pentru elementele rezistive liniare:

- laturi de tip SRC, SRT;
- laturi de tip SIC, SIT;
- laturi de tip SUCU, SICI, SUCL, SICU - comandate liniar.

relații algebrice

DAR

Notes

---

---

---

---

---

---

---

---

## Elementele rezistive neliniare

Ecuății constitutive pentru elementele rezistive neliniare:

- rezistoare neliniare;
- surse comandate neliniar;

relații algebrice neliniare

Sistemul de rezolvat va fi un sistem algebraic neliniar

Ce se întâmplă dacă surselor independente sunt variabile în timp?

## Laturi controlate în tensiune

Cazul liniar (SRC)

$$i_k = G_k u_k + j_k$$

Cazul nelinier

$$i_k = g_k(u_k)$$

$$\mathbf{i} = \mathbf{Gu} + \mathbf{j}$$

$$\mathbf{Ai} = \mathbf{0}$$

$$\mathbf{u} = \mathbf{A}^T \mathbf{V}$$

$$\mathbf{A}(\mathbf{G}\mathbf{A}^T \mathbf{V} + \mathbf{j}) = \mathbf{0}$$

$$\mathbf{i} = \mathbf{G}(\mathbf{u})$$

$$\mathbf{Ai} = \mathbf{0}$$

$$\mathbf{u} = \mathbf{A}^T \mathbf{V}$$

$$\mathbf{A}(\mathbf{G}(\mathbf{A}^T \mathbf{V})) = \mathbf{0}$$

Notes

---

---

---

---

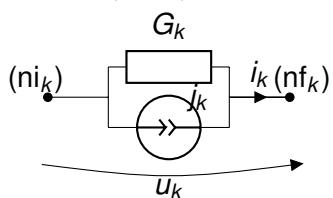

---

---

---

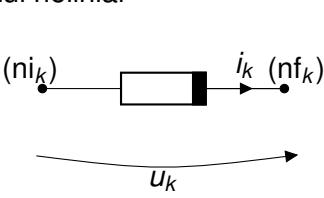

## Laturi controlate în tensiune

Cazul liniar (SRC)

$$i_k = G_k u_k + j_k$$

Cazul nelinier

$$i_k = g_k(u_k)$$

$$\mathbf{i} = \mathbf{Gu} + \mathbf{j}$$

$$\mathbf{Ai} = \mathbf{0}$$

$$\mathbf{u} = \mathbf{A}^T \mathbf{V}$$

$$\mathbf{AGA}^T \mathbf{V} = -\mathbf{Aj}$$

$$\mathbf{i} = \mathbf{G}(\mathbf{u})$$

$$\mathbf{Ai} = \mathbf{0}$$

$$\mathbf{u} = \mathbf{A}^T \mathbf{V}$$

$$\mathbf{AG}(\mathbf{A}^T \mathbf{V}) = -\mathbf{Aj}$$

Notes

---

---

---

---

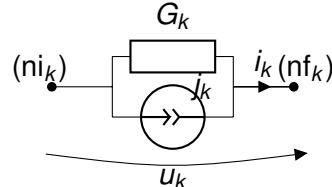

---

---

---

## Laturi controlate în tensiune

Cazul liniar (SRC)

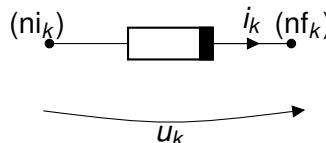

$$i_k = G_k u_k + j_k$$

**AGA<sup>T</sup>V = -Aj**

Sistem algebraic liniar

Cazul nelinier

$$i_k = g_k(u_k)$$

$$\mathbf{AG}(\mathbf{A}^T \mathbf{V}) = \mathbf{0}$$

Sistem algebraic nelinier

$$\mathbf{F(V)} = \mathbf{0} \text{ unde}$$

$$\mathbf{F(V)} = \mathbf{AG(A}^T \mathbf{V})$$

$$\mathbf{F} : \mathbb{R}^{(N-1)} \xrightarrow{\quad} \mathbb{R}^{(N-1)}$$

Notes

---

---

---

---

---

---

---

---

## Dioda semiconductoare

Modelul exponentijal (de exemplu modelul cu parametrii  $I_s$  și  $u_T$ )

$$i(u) = I_s \left( e^{\frac{u}{u_T}} - 1 \right)$$

unde  $I_s \approx 10^{-6} \text{ A}$ ,  $u_T \approx 25 \text{ mV}$

Notes

---

---

---

---

---

---

---

---

## Dioda semiconductoare

Modele liniare pe porțiuni (de exemplu - modelul cu parametrii  $u_p$ ,  $G_d$ ,  $G_i$ ) definite prin cod

$$i(u) = \begin{cases} G_i u & \text{dacă } u \leq u_p \\ G_d(u - u_p) + G_i u_p & \text{dacă } u > u_p \end{cases}$$

Notes

---

---

---

---

---

---

---

---

---

## Dioda semiconductoare

Modele liniare pe porțiuni - definite prin tabele de valori

Exemplu - modelul Ipp cu parametrii  $u_p$ ,  $G_d$ ,  $G_i$

$u$	0	$u_p$	$2u_p$
$i$	0	$G_i u_p$	$(G_i + G_d)u_p$

Notes

---

---

---

---

## Newton

Iterații Newton:

- **Ecuatie:**  $f(x) = 0$

$$x^{(m+1)} = x^{(m)} - f(x^{(m)})/f'(x^{(m)})$$

sau

$$z = f(x^{(m)})/f'(x^{(m)}) \quad (1)$$

$$x^{(m+1)} = x^{(m)} + z \quad (2)$$

- **Sistem:**  $\mathbf{F}(\mathbf{x}) = \mathbf{0}$

$$\mathbf{x}^{(m+1)} = \mathbf{x}^{(m)} - (\mathbf{F}'(\mathbf{x}^{(m)}))^{-1} \mathbf{F}(\mathbf{x}^{(m)})$$

sau

$$\mathbf{F}'(\mathbf{x}^{(m)})\mathbf{z} = \mathbf{F}(\mathbf{x}^{(m)}) \quad (3)$$

$$\mathbf{x}^{(m+1)} = \mathbf{x}^{(m)} + \mathbf{z} \quad (4)$$

## Newton

În cazul circuitelor rezistive nelineare  $\mathbf{F}(\mathbf{V}) = \mathbf{0}$  unde

$$\mathbf{F}(\mathbf{V}) = \mathbf{AG}(\mathbf{A}^T \mathbf{V})$$

Iterații Newton:

$$\mathbf{F}'(\mathbf{V}^{(m)})\mathbf{z} = -\mathbf{F}(\mathbf{V}^{(m)}) \quad (5)$$

$$\mathbf{V}^{(m+1)} = \mathbf{V}^{(m)} + \mathbf{z} \quad (6)$$

$$\mathbf{F}'(\mathbf{V}) = \mathbf{AG}'(\mathbf{A}^T \mathbf{V})\mathbf{A}^T$$

Notes

---

---

---

---

---

---

---

---

---

## Newton

În cazul circuitelor rezistive neliniare  $\mathbf{F}(\mathbf{V}) = \mathbf{0}$  unde

$$\mathbf{F}(\mathbf{V}) = \mathbf{A}\mathbf{G}(\mathbf{A}^T\mathbf{V})$$

Iterații Newton:

$$\mathbf{F}'(\mathbf{V}^{(m)})\mathbf{z} = -\mathbf{F}(\mathbf{V}^{(m)}) \quad (5)$$

$$\mathbf{V}^{(m+1)} = \mathbf{V}^{(m)} + \mathbf{z} \quad (6)$$

$$\mathbf{F}'(\mathbf{V}) = \mathbf{A}\mathbf{G}'(\mathbf{A}^T\mathbf{V})\mathbf{A}^T$$

- Calculul Jacobianului necesită evaluarea conductanțelor dinamice!

## Newton

În cazul circuitelor rezistive neliniare  $\mathbf{F}(\mathbf{V}) = \mathbf{0}$  unde

$$\mathbf{F}(\mathbf{V}) = \mathbf{A}\mathbf{G}(\mathbf{A}^T\mathbf{V})$$

Iterații Newton:

$$\mathbf{F}'(\mathbf{V}^{(m)})\mathbf{z} = -\mathbf{F}(\mathbf{V}^{(m)}) \quad (5)$$

$$\mathbf{V}^{(m+1)} = \mathbf{V}^{(m)} + \mathbf{z} \quad (6)$$

$$\mathbf{F}'(\mathbf{V}) = \mathbf{A}\mathbf{G}'(\mathbf{A}^T\mathbf{V})\mathbf{A}^T$$

- Calculul Jacobianului necesită evaluarea conductanțelor dinamice!
- Evaluarea conductanțelor dinamice depinde de modul în care au fost definite caracteristicile neliniare.

## Semnificația iterațiilor Newton

Iterații Newton:

$$\mathbf{F}'(\mathbf{V}^{(m)})\mathbf{z} = -\mathbf{F}(\mathbf{V}^{(m)}) \quad (7)$$

$$\mathbf{V}^{(m+1)} = \mathbf{V}^{(m)} + \mathbf{z} \quad (8)$$

$$\mathbf{F}(\mathbf{V}) = \mathbf{A}\mathbf{G}(\mathbf{A}^T\mathbf{V})$$

$$\mathbf{F}'(\mathbf{V}) = \mathbf{A}\mathbf{G}'(\mathbf{A}^T\mathbf{V})\mathbf{A}^T$$

$$\mathbf{AG}'(\mathbf{A}^T\mathbf{V}^{(m)})\mathbf{A}^T\mathbf{z} = -\mathbf{AG}(\mathbf{A}^T\mathbf{V}^{(m)}) \quad (9)$$

Liniare (SRC)

$$\mathbf{AGA}^T\mathbf{V} = -\mathbf{Aj}$$

Notes

---

---

---

---

---

---

---

---

## Semnificația iterațiilor Newton

Iterații Newton:

$$\mathbf{F}'(\mathbf{V}^{(m)})\mathbf{z} = -\mathbf{F}(\mathbf{V}^{(m)}) \quad (7)$$

$$\mathbf{V}^{(m+1)} = \mathbf{V}^{(m)} + \mathbf{z} \quad (8)$$

$$\mathbf{F}(\mathbf{V}) = \mathbf{A}\mathbf{G}(\mathbf{A}^T\mathbf{V})$$

$$\mathbf{F}'(\mathbf{V}) = \mathbf{A}\mathbf{G}'(\mathbf{A}^T\mathbf{V})\mathbf{A}^T$$

$$\mathbf{AG}'(\mathbf{A}^T\mathbf{V}^{(m)})\mathbf{A}^T\mathbf{z} = -\mathbf{AG}(\mathbf{A}^T\mathbf{V}^{(m)}) \quad (9)$$

Liniare (SRC)

$$\mathbf{AGA}^T\mathbf{V} = -\mathbf{Aj}$$

Semnificația relației (9):

Notes

---

---

---

---

---

---

---

## Circuite incrementale/liniarizate

Neliniar

$$\mathbf{AG}'(\mathbf{A}^T \mathbf{V}^{(m)}) \mathbf{A}^T \mathbf{z} = -\mathbf{AG}(\mathbf{A}^T \mathbf{V}^{(m)})$$

Liniar

$$\mathbf{AGA}^T \mathbf{V} = -\mathbf{Aj}$$

$$z_{ni_k} = V_{ni_k}^{(m+1)} - V_{ni_k}^{(m)} \quad z_{nf_k} = V_{nf_k}^{(m+1)} - V_{nf_k}^{(m)}$$

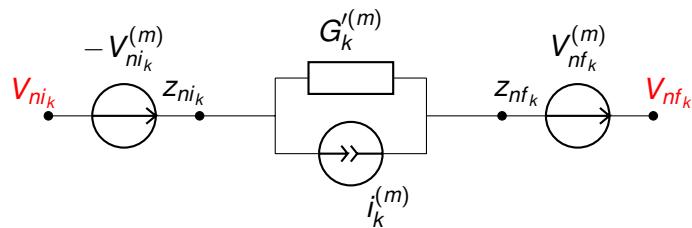

## Circuite incrementale/liniarizate

Neliniar

$$\mathbf{AG}'(\mathbf{A}^T \mathbf{V}^{(m)}) \mathbf{A}^T \mathbf{z} = -\mathbf{AG}(\mathbf{A}^T \mathbf{V}^{(m)})$$

Liniar

$$\mathbf{AGA}^T \mathbf{V} = -\mathbf{Aj}$$

$$z_{ni_k} = V_{ni_k}^{(m+1)} - V_{ni_k}^{(m)} \quad z_{nf_k} = V_{nf_k}^{(m+1)} - V_{nf_k}^{(m)}$$

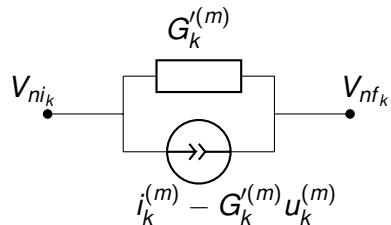

## Circuite incrementale/liniarizate

Neliniar

$$\mathbf{AG}'(\mathbf{A}^T \mathbf{V}^{(m)}) \mathbf{A}^T \mathbf{z} = -\mathbf{AG}(\mathbf{A}^T \mathbf{V}^{(m)})$$

Liniar

$$\mathbf{AGA}^T \mathbf{V} = -\mathbf{Aj}$$

Circuit liniarizat →

La fiecare iterație se rezolvă un circuit liniar, potențialele lui reprezintă soluțiile noi în iterările Newton

Notes

---

---

---

---

---

---

---

---

---

## Algoritm - bazat pe asamblare de circuite

Ideea (nr. 1):

Se rezolvă o succesiune de circuite rezistive liniare (liniarizate).

it = 0

initializează soluția  $\mathbf{V}$

repetă

it = it + 1

înlocuiește elementele neliniare cu schemele lor liniarizate  
rezolvă circuitul rezistiv liniar și calculează  $\mathbf{V_n}$

actualizează soluția  $\mathbf{V} = \mathbf{V_n}$

dacă it == itmax scrie mesaj de eroare

cât timp  $\text{norma}(\mathbf{V} - \mathbf{Vnou}) > \text{toleranța impusă și}$  it < itmax

Notes

---

---

---

---

---

---

---

---

---

## Algoritm - bazat pe rezolvare de circuite

Ideea (nr. 2):

Se rezolvă o succesiune de circuite rezistive liniare (incrementale).

it = 0

initializează soluția  $\mathbf{V}$

repetă

    it = it + 1

    înlocuiește elementele neliniare cu schemele lor *incrementale*  
    rezolvă circuitul rezistiv liniar și calculează corectiile  $\mathbf{z}$

    actualizează soluția  $\mathbf{V} = \mathbf{V} + \mathbf{z}$

    dacă it == itmax scrie mesaj de eroare

cât timp norma( $\mathbf{z}$ ) > toleranța impusă și it < itmax

Notes

---

---

---

---

---

---

---

---

---

---

---

---

## Algoritm - bazat pe operații cu matrice

Ideea (nr. 3):

Se rezolvă o succesiune de sisteme algebrice liniare.

it = 0

asamblează matricea  $\mathbf{A}$

initializează soluția  $\mathbf{V}$

repetă

    it = it + 1

    calculează conductanțele dinamice și asamblează  $\mathbf{G}'$   
    rezolvă sistemul liniar  $\mathbf{AG}'\mathbf{A}^T\mathbf{z} = -\mathbf{Ai}$  și calculează corectiile  $\mathbf{z}$   
    actualizează soluția  $\mathbf{V} = \mathbf{V} + \mathbf{z}$

    dacă it == itmax scrie mesaj de eroare

cât timp norma( $\mathbf{z}$ ) > toleranța impusă și it < itmax

## Cel mai simplu algoritm - pe ce ne bazăm

Primul algoritm scris pentru circuite rezistive liniare (crl) - laturi SRT

```
; declaratii date - varianta A
intreg N
intreg L
tablou intreg ni[L]
tablou intreg nf[L]
tablou real R[L]
tablou real e[L]
; număr de noduri
; număr de laturi
; noduri initiale ale laturilor
; noduri finale ale laturilor
; rezistențe
; tensiuni electromotoare
```

Notes

---

---

---

---

---

---

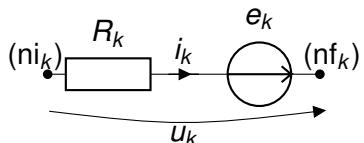

---

---

---

## Cel mai simplu algoritm - pe ce ne bazăm

Primul algoritm scris pentru circuite rezistive liniare (crl) - laturi SRT

```
; declaratii date - varianta B
inregistrare circuit
intreg N ; număr de noduri
intreg L ; număr de laturi
tablou intreg ni[L] ; noduri initiale ale laturilor
tablou intreg nf[L] ; noduri finale ale laturilor
tablou real R[L] ; rezistențe
tablou real e[L] ; tensiuni electromotoare
```

Notes

---

---

---

---

---

---

---

---

---

## Cel mai simplu algoritm - pe ce ne bazăm

Să pp că avem la dispoziție o procedură:

procedură **nodal\_crl(circuit,v)**

; rezolvă un circuit rezistiv liniar cu metoda nodală  
; date de intrare: structura circuit  
; ieșire: valorile potențialelor  $v$  în noduri, ultimul nod este de referință  
...  
return

Obs: procedura cuprinde atât asamblarea sistemului de ecuații  
cât și rezolvarea lui.

## Cel mai simplu algoritm - ce e nou

- Admetem acum în plus, laturi rezistive neliniare, controlate în tensiune;

Vom presupune că există câte o procedură care poate, pentru orice latură neliniară, să întoarcă

- currentul prin latură pentru o tensiune dată ( $i_k = g_k(u_k)$ );  
Dacă curbele neliniare sunt date tabelar - aceasta presupune o **interpolare**).
- conductanță dinamică a laturii, pentru o tensiune dată ( $G'_k = g'_k(u_k)$ ).  
Dacă curbele neliniare sunt date tabelar - aceasta presupune o **derivare numerică**.

---

## Cel mai simplu algoritm - etapa de preprocesare

Variante - pentru partea neliniară:

```

        functie g(u)
        nd = 3 ; numărul de puncte de discontinuitate
functie g(u)
Is = 1e-12
Vt = 0.0278
întoarce Is*(exp(u/Vt)-1) întoarce val(m) + (ival(m+1) - ival(m))/(aval(m+1)-uval(m))*(u - uval(m))
    uval = ....
    ival = ....
    m = cauta(uval, ival, u)

```

```

functie gder(u)          functie gder(u)
Is = 1e-12                  nd = 3 ; numărul de puncte de discontinuitate
Vt = 0.0278                  uval = ....
întoarce Is*exp(u/Vt)/Vt  ival = ....
                                m = cauta(uval, ival, u)
                                întoarce (ival(m+1) - ival(m))/(aval(m+1)-aval(m))

```

Is, Vt, nd, uval, ival - pot fi citite în etapa de preprocesare (și pot fi diferite pentru diferitele elemente neliniare).

Algorithm - v3

```

procedură solve_crnl_v3(circuit,tol,itmax,V)
circuit - structură - parametru de intrare
tol, itmax - parametri de intrare, specifici procedurii Newton
V - vector - parametru de ieșire
...
asamblează matricea incidentelor laturi noduri
A = 0; matrice de dimensiune N x L
pentru k = 1:L
    i = circuit.ni(k);
    j = circuit.nf(k);
    A(i,k) = 1;
    A(j,k) = -1;
•
A(N,:) = []; elimină ultima linie
V = 0; vector de dimensiune N-1
err = 0.01;
cor = 1;
itk = 0;
cât timp abs(norm(cor)) > err și itk < itmax

Algorithm - v3

funcție F(u)

...  
 $\text{Gd} = \mathbf{0}$ ; vector coloană de dimensiune L  
pentru  $k = 1:L$

- dacă circuit.tip(k) == "I"  
 $G(k) = (u(k) + \text{circuit.e}(k)) / \text{circuit.R}(k)$
- altfel  
 $G(k) = \text{g}(u(k))$

•

întoarce  $A * G$

funcție Fder(u)

...  
 $\text{Gd} = \mathbf{0}$ ; vector coloană de dimensiune L  
pentru  $k = 1:L$

- dacă circuit.tip(k) == "I"  
 $\text{Gd}(k) = 1 / \text{circuit.R}(k)$
- altfel  
 $\text{Gd}(k) = \text{gder}(u(k))$

•

$\text{Gder} = \text{diag}(\text{Gd})$   
 $\text{întoarce } A * \text{Gder} * A^T$

Aici structura circuit și matricea **A** sunt pp. globale, altfel trebuie date ca parametri.

## Concluzii

- Analiza circuitelor rezistive nelineare se reduce la o succesiune de rezolvări de sisteme algebrice liniare (care pot fi privite ca rezolvări de circuite rezistive liniare - incrementale sau liniarizate).
- Convergența procedurii depinde de inițializare.
- Numărul de iterații depinde de inițializare și de eroarea impusă soluției.

Notes

---

---

---

---

---

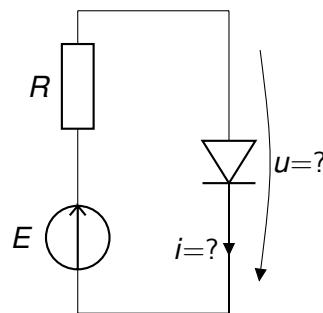

---

---

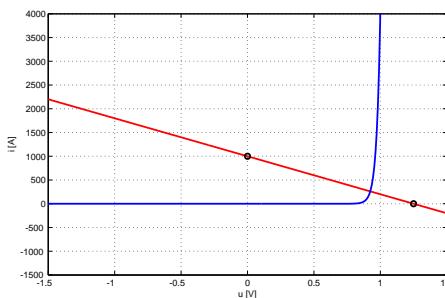

---

---

---

## Cazul caracteristicilor lpp

- Eroarea impusă nu influențează prea mult numărul de iterații deoarece după determinarea corectă a segmentului în care se află PSF, eroarea impusă este satisfăcută la următoarea iterație.
- Dacă inițializarea corespunde combinației corecte de segmente, atunci se va face exact o singură iterație.
- Numărul maxim de iterații este egal cu numărul maxim de combinații de segmente.
- Există o variantă a metodei (cunoscută sub numele de metoda Katzenelson) în care la fiecare iterăție se modifică un singur segment, cel corespunzător variației maxime.  
Avantaj - convergența garantată.
